

DIGITAL ID

It is through identity validations, whether online or offline, that we gain access to essential services, whether public or private, national or international.

Conducting reliable and protective identification processes in the digital world is necessary for the digital public infrastructure to operate.

At the same time, the same challenges of proper identification have remained or worsened in the digital context.

A digital identity can be one more way to facilitate the process of identity authentication, making access to goods and services more secure and less bureaucratic.

You may think you've never used a digital identity, but have you ever thought about these cases?

when we create an email and use it as an authenticator to access other services and validate that you are the person who receives correspondence via that email;

when we access a digital public service through our single sign on tool, i.e. Gov.br account in Brazil, without having to send a copy of our identity every time;

when we take a photo of our face in the bank app to validate a bank transaction.

Although there are some examples of digital identities already implemented, many different contexts claim to be digital identity systems. This shows that this tool can have many meanings and applications.
